

# NEWS ALERT

## Give Plants a Probiotic Boost This Spring!

The normal recipe for lush green lawns or robust crop growth is to add more fertilizer. However, while macronutrients like nitrogen and phosphorus show dramatic results, they often are synthetically manufactured and add to nutrient pollution in waterways. Bionetix® offers a gentler approach with probiotic fertilizers for lawns and gardens.

### Build Healthy Turf

**ECO-TURF™** is a biofertilizer that adds beneficial microorganisms to the soil, helping break down organic matter to make nutrients more accessible. Plant extracts in ECO-TURF™ serve as natural growth hormones to foster healthy growth, while natural surfactants work as wetting agents to help roots make better use of available moisture even in drought conditions. ECO-TURF™ also has humic and fulvic acids that foster a healthy growing environment. ECO-TURF™ can be applied every two to four weeks when watering lawns, golf courses, sod farms, and sports fields.

### Activate Plant Growth

**SOIL-BAC™** and SOIL-BAC™ Premium can also be used on grassy areas but are specifically targeted at garden plants and farm crops. In addition to beneficial microorganisms that help enrich the soil through enhanced decomposition, SOIL-BAC™ contains mycorrhizae to help roots absorb nutrients better and rhizobacteria to promote plant growth. For an extra boost, SOIL-BAC™ Premium includes special microorganisms capable of atmospheric nitrogen fixation. The presence of both symbiotic and free-living microorganisms means this can be achieved even before vegetation starts to grow, making SOIL-BAC™ Premium great for application at spring planting time!

### Get Growing with Probiotics!

The upcoming growing season is a great time to dial back the heavy use of synthetic chemicals and enjoy the benefits of natural nutrients and microorganisms that support healthy growth in lawns and gardens.
